

Georgeapp Repo Summary

One-page evidence-based overview generated from the repository.

Georgeapp is a single-page React + Vite interface for browsing a short set of chapter-style story cards about George.

The current repo shows a touch-friendly reading experience with progress tracking and a placeholder listen action, not a full content platform.

Primary persona: a mobile-first reader or listener exploring a chapter-based narrative about George.

- Shows four in-memory chapter cards with title, body copy, and accent color.
- Lets users swipe left/right between cards with pointer events and snap thresholds.
- Supports back navigation to the previous card from the fixed header.
- Displays reading progress as a header progress bar tied to the active card.
- Offers clickable progress dots for direct card selection.
- Renders a prominent "Tap to listen" button with press/hover animation.
- Applies mobile-oriented visual styling with fixed header, dotted background, and card motion effects.

Browser -> index.html mounts React at #root -> src/main.jsx renders App inside StrictMode.

App.jsx stores the chapter data locally in a CARDS array and manages active index, drag offset, and dragging state with React hooks.

Header.jsx receives title, progress, and onBack props from App and renders the fixed top bar.

App.css and Header.css provide layout, animations, and touch-focused presentation.

Services/API/persistence/audio playback: Not found in repo.

1. Open a terminal in georgeapp/.
2. Install dependencies: npm install
3. Start local dev server: npm run dev
4. Open the local Vite URL shown in the terminal.

Build/preview scripts exist in package.json: npm run build and npm run preview.
